AB The determination of dissolved or suspended impurities in petroleum was important to find solns. for an economic processing. A highly sensitive x-ray fluorescence method was developed to determine the metal, sulfur, and chloride content in petroleum products over a broad range. Several modifications of the instrument allowed the selection of optimum adjustment for specific measurements. Besides the solving of the anal. problems of petroleum products, the instrumentation could also be used to analyze alloys, waste water and to perform environmental analyses. REFERENCE COUNT: 3

AB The application of Spektroskan apparatus in elemental anal. of petroleum products, especially in lubricating oils was studied. The parameters of x-ray spectral fluorescence anal. of different metals in lubricating oil using this instrument were presented. The reproducibility data for S and chloride anal. in petroleum products were also discussed.

AB Determination of different elements in crude oil by x-ray fluorescence anal. is described. The measurements were performed with an x-ray fluorescence spectrometer with a hyperpure germanium detector with a resolution of 180 eV and a 45 MCi 241Am source encapsulated in stainless steel. A calibration line was established using com. standard solns. The results are satisfactorily, and the advantages of this method are speed, simultaneous multielemental determination and various possible applications.

AB A completely automated apparatus is claimed for the continuous detn of trace elements (e.g. S in petroleum) by x-ray fluorescence (x-rays from a Ag-Sn target bombarded with radiation from a 241Am source). The apparatus does not employ a so-called log amplifier and is used when the changes occurring in the d. of the hydrocarbon and in the concentration of the trace elements are relatively small, d. compensation being carried out for the hydrocarbon and output being given in a linear fashion.
